an understanding of the immune system is central to the understanding of how the body interacts with its surroundings presenting an insight into this biological system this book leads students through both innate and adaptive immunity how infection is detected and how the cells of the immune system interact to generate a response

this book has been cunningly designed to provide an overview of our current knowledge about the innate immune systems of these three types of organisms it not only covers the innate immune mechanisms and responses of such diverse organisms as plants cnidaria drosophila urochordates and zebrafish but also the major receptor systems in mammals and humans it delves too into the central defense mechanisms antimicrobial peptides and the complement system

a leading figure in immunology takes readers inside the remarkably powerful human immune system winner of the choice outstanding academic title of the choice acrl the immune system has incredible power to protect us from the ravages of infection boosted by vaccines it can protect us from diseases such as measles however the power of the immune system is a double edged sword an overactive immune system can wreak havoc destroying normal tissue and causing diseases such as type i diabetes rheumatoid arthritis and multiple sclerosis the consequences of an impaired immune system on the other hand are all too evident in the agonies of aids packed with illustrations stories from dr william e paul s distinguished career and fascinating accounts of scientific discovery immunity presents the three laws of the human immune system universality tolerance and appropriateness and explains how the system both protects and harms us from the tale of how smallpox was overcome and the lessons of the ebola epidemic to the hope that the immune system can be used to treat or prevent cancer dr paul argues that we must take advantage of cutting edge technologies and promising new tools in immunological research

the understanding at the molecular level of the interactions between innate and adaptive arms of the immune system is currently a hot topic particularly to those interested in immunology especially susceptibility to infectious diseases this book provides a survey of topics in the area of innate and adaptive immunity which have been researched within the mrc immunochemistry unit at oxford university over a period of forty years the topics include antibody structure for which the first director of the immunochemistry unit professor rr porter was awarded a nobel prize in 1972 the characterization of membrane proteins on lymphoid cells leading to the concept of these molecules belonging to an immunoglobulin super family the proteins of the human serum complement system one of the body s major defences against microbial infection the human cell surface integrins and the hyaluronan binding proteins which are involved in regulation of inflammation at cell surfaces and within the extracellular matrix the

family of collectin molecules containing distinct globular carbohydrate binding domains linked to collagen like regions which play important roles in innate immunity in the lungs and bloodstream by immediate recognition and clearance of microbial pathogens each chapter in the book gives a brief historical background to a topic and then provides a survey of recent advances in the field and are written by internationally recognised renowned experts the theme running through the chapters is that of protein structure function relationships including amongst others descriptions of quaternary structures of large oligomeric proteins of factor h and clq binding to specific ligands and of the chemistry of the mechanism of catalysis of covalent binding of activated c3 and c4 proteins to nucleophilic groups on microbial surfaces in several chapters excellent descriptions are given with respect to how the immune system can be recruited to combat microbial infection via proteins of both the innate and adaptive immune systems the book also includes notable chapters which are excellent examples of the importance of how the isolation characterisation protein engineering and crystallisation has resulted in a full understanding of complex protein protein interactions involved in the recognition and triggering events of important sections of the immune system structure and function of the c1 complex gúard j arlaud chemical engineering of therapeutic antibodies george t stevenson leukocyte surface proteins purification and characterisation a neil barclay cell surface integrins suet mien tan and s k alex law this book is aimed primarily at established senior research scientists postdoctoral research scientists and phd students who have an interest in proteins of the immune system however the wide range of immunity system topics while staying broadly within innate adaptive immunity will also appeal to a wider audience

our understanding of the complex innate immune response is increasing rapidly its role in the protection against viral or bacterial pathogens is essential for the survival of an organism however it is equally important to avoid unregulated inflammation because innate immune responses can cause or promote chronic autoinflammatory diseases such as gout atherosclerosis type 2 diabetes or certain aspects of the metabolic syndrome in this book leading international experts in the field of innate immunity share their findings define the state of the art in this field and evaluate how insight into the molecular basis of these diseases could help in the design of new therapies a tremendous amount of work on the innate immune response has been done over the last fifteen years culminating in the 2011

nobel prize in physiology medicine awarded for the discoveries of toll genes in immunity in flies membrane bound toll like receptors in mammals and dendritic cells as initiators of adaptive immunity

natural immunity is a broadly based account of the activities of the evolutionarily conserved molecules cells and processes of the natural immune system this encompasses the early host protection against microbes bacteria and viruses and tumours prior to the generation of the adaptive immune response diverse major current pathologies including inflammatory and autoimmune diseases and key roles in essential physiological processes such as reproduction and wound healing the first comprehensive book on natural immunity reviews new topics effects of behaviour aging and exercise and diet on natural immunity highlights the physiological role of natural immunity focuses on the relationship of the neuroendocrine system with natural immunity brings together the diversity and complexity of natural immune system activity

in recent years increased scientific attention has been given to immediate defense mechanisms based on non clonal recognition of microbial components these mechanisms constitute the innate immunity arm of the body s defense identification of pathogens by these mechanisms involves primarily receptors recognizing sugar moieties of various microorganisms innate immunity based mechanisms are essential for the existence of multicellular organisms they are evolutionarily conserved and designed to provide immediate protection against microbial pathogens to eradicate infection activation of innate immunity is crucial for transition to specific immunity and for its orientation and to assist the specific immune response in the recognition of pathogens and their destruction innate immunity is regularly involved in the arrest of bacterial mycotic viral and parasitic infections giving the specific immune response time to become effective it becomes critically essential in immunocompromised patients who fail to mount specific immune responses due to congenital or acquired immunodeficiencies as a result of chemotherapy dialysis immunosuppressive drugs or hiv infection the innate immunity arsenal constitutes polymorphonuclear and mononuclear phagocytes mast cells the complement system natural killer cells antimicrobial peptides and presumably a subset of t lymphocytes with tcrl receptors

innate immunity has long been regarded as the non specific arm of immune response acting immediately and in a generic way to defend the host from infections in the post genomic era our knowledge of the

innate immune system is enriched by findings on the specificity of innate immune reactions as well as to novel functions that do not strictly correlate with immunological defense and surveillance immune modulation or inflammation several studies indicate that molecules involved in innate immunity exert functions that are either more complex than previously thought or go well beyond the innate immune character of the system the advent of high throughput platforms for genome and proteome wide profiling together with the enormous amount of raw genetic information that has accumulated in the databases have stirred new expectations in biomedical research they have led scientists to revisit established biological systems from a global and integrative perspective innate immunity research is now faced with the challenge of trying to integrate isolated biochemical pathways into complex gene and protein regulatory circuits in this respect scientists from around the world convened at the 4th international conference on innate immunity june 4 9 2006 in corfu greece to discuss recent advances in this fast evolving field this volume represents a collection of topics on natural killer cells mast cells phagocytes toll like receptors complement host defense in plants and invertebrates evasion strategies of microorganisms pathophysiology protein structures design of therapeutics and experimental approaches discussed during the conference

this contributed volume follows up and expands upon target pattern recognition in innate immunity 2009 providing a much needed update on an area that has surged to the forefront of medical research in recent years from the initial idea of pattern recognition on microbial surfaces innate immunity is now recognized as a key player in human health and disease by virtue of its ability to regulate adaptive immune responses with important physiological and pathological consequences this book presents cutting edge research and future perspectives on nearly all aspects of innate immunity coverage includes cells of the innate immune system pattern recognition receptors and effector mechanisms soluble prrs and humoral factors immune response to viral bacterial fungal and parasitic pathogens disease mechanisms and comparative studies in non mammalian innate immunity it is an excellent introduction to the field for students and state of the art reference for researchers and professionals

all multicellular organisms may possess innate immunity mediated by defense mechanisms with which the organism is born in recent years much has been learned about the diversity of innate immune mechanisms

a large array of naturally produced antimicrobial peptides has been defined a variety of cell surface receptors that recognize common patterns displayed by infectious organisms have been identified along with the intracellular pathways that these receptors use to activate cellular defense functions cell surface receptors on natural killer nk cells have been shown to sense microbial invasion in neighboring cells thereby setting into motion their elimination by cytotoxic mechanisms other receptors have been found to facilitate phagocytosis and intracellular killing of microbes by phagocytic cells these and other natural defense mechanisms have traditionally been viewed as the first line of body defense in vertebrate species that also possess the capacity for acquired or adaptive immunity sharks and all of the other jawed vertebrates generate large repertoires of t and b lymphocyte clones that display different antigen specific receptors in the form of cell receptors tcr and immunoglobulins ig that allow them to recognize and respond to antigens in collaboration with antigen presenting cells memory t and b cells are then generated to allow faster and heightened cellular and humoral immune responses on secondary antigen encounter in recent years it has also become obvious that innate immune responses can directly influence adaptive immune responses in ways that will enhance body defense

this book takes the reader on an inspiring journey into the immune system challenging long held beliefs about immunity it examines the immune system under historical philosophical and biological perspectives it proposes a new way of understanding immunity that goes beyond the binary opposition between self and non self indeed we the livings are chimeras mammals birds reptiles or fish insects spiders or mollusks plants or algae we are all made up of a community of living beings who share their lives in the same meta organism if we live together it is because we need each other to live and if we can live together it is because an immune system makes it possible by adapting

us to them and by adapting them to us from this mutual adaptation a new kind of immunity emerges dynamic relational never acquired an endless immunity immunity that this system makes possible is not perfect far from it it is a compromise which does not always prevent disease sometimes it even causes it disease is the cost of immunity because what the immune system enables is much more essential than the defense of the organism it is the very existence of the meta organism that we are immunity is more than a protection it is a condition of existence with its didactic structure and accessible style this book is an essential resource for anyone interested in understanding timmunity and the immune system it offers different levels of complexity from which the reader can choose depending on his or her background without compromising the main message of the text with a foreword by alfred i tauber
